# Symmetry Breaking for Multi-Criteria Mapping and Scheduling on Multicores

Pranav Tendulkar Peter Poplavko Oded Maler

August 2013

4 **A b b b b b b** 

### Context

- Typical in parallel programming: spawn multiple identical tasks
  - data parallelism
  - obtain hyperperiod of a multi-periodic system
  - duplicate tasks for fault-tolerance

### Context

- Typical in parallel programming: spawn multiple identical tasks
  - data parallelism
  - obtain hyperperiod of a multi-periodic system
  - duplicate tasks for fault-tolerance
- Often the platform have multiple identical processors.

# Model of Computation

### synchronous dataflow graphs (SDF)

by E. Lee and D. Messerschmitt in 1987 task graph + symbolic representation of data parallelism signal-processing, video-coding applications

#### a 'standard' in academic multicore compilers:

Streamlt compiler of MIT

#### we introduce split-join graphs : restriction of SDF

still covering perhaps 90% of use cases

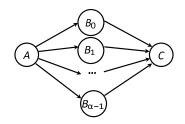

a simple split-join graph example:

 $\alpha$  : spawn and split

 $1/\alpha$ : wait and join

### Definition (Split-Join Graph)

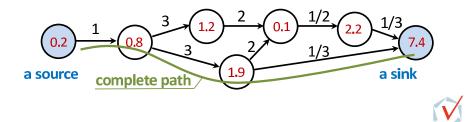

- $S = (V, E, d, \alpha), (V, E)$ : DAG, V:actors, E:channels
- $d: V \rightarrow \mathbb{R}_+$ : actor execution time,
- $\alpha: E \to \mathbb{Q}$ : channel counter: split (> 1), join (< 1) or neutral (= 1)

### Definition (Split-Join Graph)

### $S = (V, E, d, \alpha), (V, E)$ : DAG, V:actors, E:channels

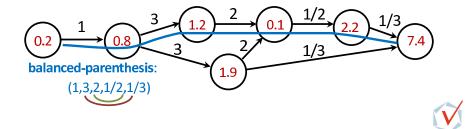

- $d: V \rightarrow \mathbb{R}_+$ : actor execution time,
- $\alpha: E \to \mathbb{Q}$ : channel counter: split (> 1), join (< 1) or neutral (= 1)

### Definition (Split-Join Graph)

 $S = (V, E, d, \alpha), (V, E)$ : DAG, V:actors, E:channels  $d: V \rightarrow \mathbb{R}_+$ : actor execution time,

 $\alpha: E \to \mathbb{Q}$ : channel counter: split (> 1), join (< 1) or neutral (= 1)

< ロ > < 同 > < 回 > < 回 >

### Well-behaved Graphs

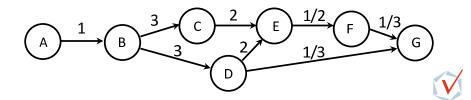

### Definition (Well-behaved)

 $S = (V, E, d, \alpha)$  is well-behaved if any complete path has balanced-parenthesis signature

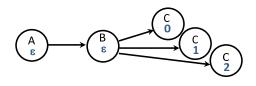

Such a graph can be unfolded to a task graph.

- 3. Generate the mapping and scheduling constraints:
  - Precedence
  - Mutual Exclusion
  - Buffer Capacity (Extended Problem see the paper)
- 4. Cost-space exploration using SMT solver.

Decision variables:

•  $\mu(u), u \in U$  - the mapping: processor (1,2,...,*M*) for *u* 

< ロ > < 同 > < 回 > < 回 >

Given a split-join graph S, we perform the following steps:

- 1. Check whether S is well-behaved
- 2. Unfold *S* into task graph  $T = (U, \mathcal{E}, \delta)$
- 3. Generate the mapping and scheduling constraints:
  - Precedence
  - Mutual Exclusion
  - Buffer Capacity (Extended Problem see the paper)
- 4. Cost-space exploration using SMT solver.

Decision variables:

- $\mu(u), u \in U$  the mapping: processor (1,2,...,*M*) for *u*
- *s*(*u*) the schedule: start time of *u*

< ロ > < 同 > < 回 > < 回 >

## Constraints

Predicate  $\varphi(u, u')$ : task u' starts after the completion of task u

$$arphi(u,u'): oldsymbol{s}(u') \geq oldsymbol{s}(u) + \delta(u)$$

B + 4 B +

#### Constraints

Predicate  $\varphi(u, u')$ : task u' starts after the completion of task u

$$\varphi(u, u')$$
 :  $s(u') \ge s(u) + \delta(u)$ 

Precedence:

 $\bigwedge_{(u,u')\in\mathcal{E}}\varphi(u,u')$ 

< ロ > < 同 > < 回 > < 回 >

#### Constraints

Predicate  $\varphi(u, u')$ : task u' starts after the completion of task u

$$\varphi(u, u') : s(u') \ge s(u) + \delta(u)$$

Precedence:

$$\bigwedge_{u,u')\in\mathcal{E}}\varphi(u,u')$$

(

Mutual exclusion:

$$\bigwedge_{u\neq u'\in U} (\mu(u)=\mu(u')) \Rightarrow \varphi(u,u') \lor \varphi(u',u)$$

## Outline

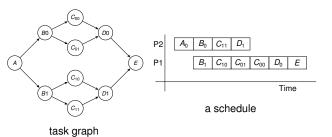

- Motivation
- 2 Application Model
- Problem Formulation SMT

#### Symmetry Breaking

- 5 Cost Space Exploration
- 6 Experiments and Results
  - Conclusions

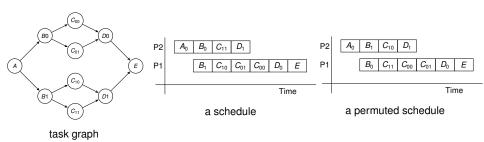

3 > 4 3

• all instances of given actor v are similar (symmetric)

• • • • • • • • • • • •

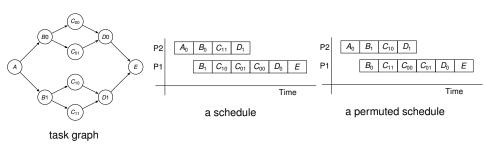

• all instances of given actor v are similar (symmetric)

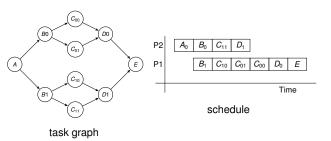

• • • • • • • • • • • •

ъ

- all instances of given actor v are similar (symmetric)
- permutation of symmetric tasks does not change the latency,
- ... but extends the solution space exponentially

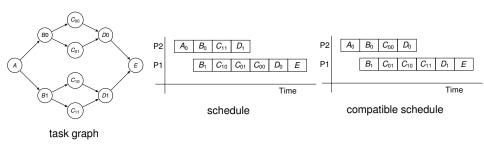

• enforce the schedule to be compatible with lexicographic order:  $s(C_{00}) \le s(C_{01}) \le s(C_{10}) \le s(C_{11})$ 

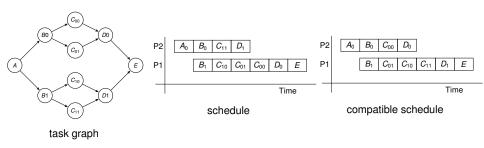

• • • • • • • • • • • • •

• enforce the schedule to be compatible with lexicographic order:  $s(C_{00}) \le s(C_{01}) \le s(C_{10}) \le s(C_{11})$ 

- enforce the schedule to be compatible with lexicographic order:  $s(C_{00}) \le s(C_{01}) \le s(C_{10}) \le s(C_{11})$
- Theorem: adding constraints s(u) ≤ s(u') for u ≪ u' does not eliminate optimality

• • • • • • • • • • • •

modify a feasible schedule such that:  $s(v_0) \le s(v_1) \le s(v_2) \le ...$ 

prove that precedence constraints are satisfied

 $\checkmark$  here: for neutral channels (  $\alpha$  = 1 ), unfolded to (v<sub>h</sub>, v'<sub>h</sub>)

lexicographic order

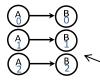

start-time compatible

new hier. index; new precedence relation

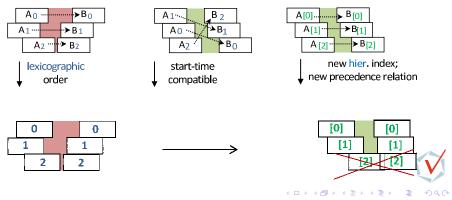

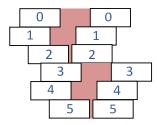

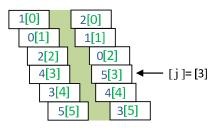

modify a feasible schedule such that:  $s(v_0) \le s(v_1) \le s(v_2) \le ...$ 

prove that precedence constraints are satisfied

 $\checkmark$  here: for neutral channels (  $\alpha$  = 1 ), unfolded to (v<sub>h</sub>, v'<sub>h</sub>)

cost space  $(C_L, C_M)$  exploration for  $\alpha = 30$ evaluate task and processor symmetry breaking

#### Video Decoder

3D cost space  $(C_L, C_M, C_B)$  exploration,  $C_B$  - total buffer size

MPEG video decoder:

## Video Decoder

3D cost space  $(C_L, C_M, C_B)$  exploration,  $C_B$  - total buffer size

MPEG video decoder:

- Symbolic representation of data-parallel programs
  - a useful subclass of SDF model
- Framework for multi-criteria optimal deployment
- Symmetry breaking: prove task symmetry and use processor symmetry

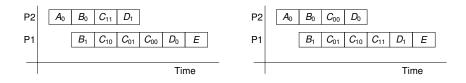

• • • • • • • • • • • • •

- Symbolic representation of data-parallel programs
  - a useful subclass of SDF model
- Framework for multi-criteria optimal deployment
- Symmetry breaking: prove task symmetry and use processor symmetry
- Future work:

- Symbolic representation of data-parallel programs
  - a useful subclass of SDF model
- Framework for multi-criteria optimal deployment
- Symmetry breaking: prove task symmetry and use processor symmetry
- Future work:
- More symmetry breaking, also approximation and heuristics
- More refined data communication: data transfer delays
- Pipelined scheduling
- Scheduling under uncertainty
- Multistage design flow
